ACG Virtual Grand Rounds universe.gi.org

Participating in the Webinar

Moderator:
Catherine T. Hudson, MD, MPH

All attendees will be muted and will remain in "Listen Only Mode"

Type your questions here so that the moderator can see them.
Not all questions will be answered but we will get to as many as possible.

A handout with the slides and room to take notes can be downloaded from your control panel.

ACG Virtual Grand Rounds

Join us for upcoming Virtual Grand Rounds!

Week 26 – Thursday June 26, 2025
 GI Nutrition Care Series: Weight Inclusive Care & Bias
 Faculty: Carolyn Newberry, MD
 Moderator: Beth Rosen, MS, RD, CDN
At Noon and 8pm Eastern

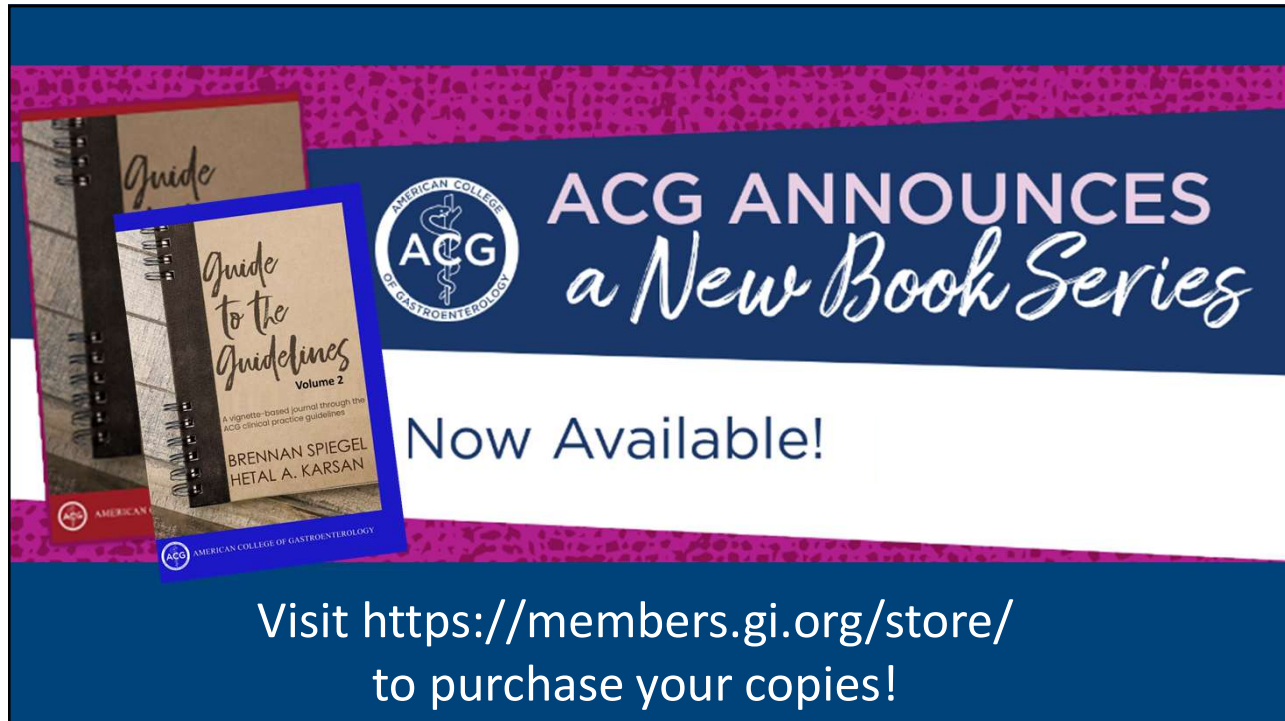

Week 27 – Thursday, July 3, 2025 - NO VGR

Week 28 – Thursday July 10, 2025
 Evaluation and Management of Chronic Abdominal Pain and Suspected IBS
 Faculty: Jill K. Deutsch, MD
 Moderator: Amy L. Ogurick, MD
At Noon and 8pm Eastern

Visit gi.org/ACGVGR to Register

GLP-1s and GI Complications What Every Clinician Needs to Know

Michael Camilleri, MD, MACG
C.E.N.T.E.R Program, Mayo Clinic, Rochester, MN

©2012 MFMER | slide-9

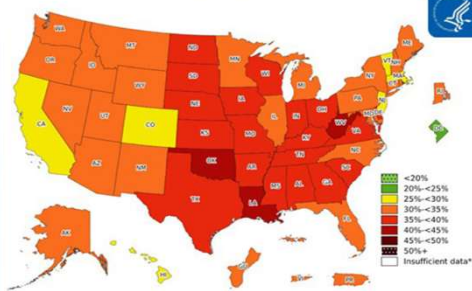

9

ACG Virtual Grand Rounds universe.gi.org

Overall Objective

To explain mechanisms and management of GLP-1-induced effects in gastroenterology and endoscopic practice

Prevalence¹ of Obesity Based on Self-Reported Weight and Height Among U.S. Adults by State and Territory, BRFSS, 2022

Source: Behavioral Risk Factor Surveillance System
*Sample size <50, the relative standard error (dividing the standard error by the prevalence) ≥30%, or no data in a specific year.

Specific Objectives

- Case Study
- Neurohormonal responses to nutrient intake
- Actions of GLP-1
- Currently approved incretin agonists
- Beneficial effects on obesity, co-morbidities, GI and liver
- Effects on gastric emptying: positives and negatives
- EGD: Retained gastric content, Risk of aspiration, gastroparesis
- Recommendations

©2012 MFMER | slide-10

10

ACG Virtual Grand Rounds universe.gi.org

MOC Statement #1

- I will learn about the beneficial effects of GLP-1 agents on weight loss, diabetes control and other health benefits

©2012 MFMR | slide-11

11

ACG Virtual Grand Rounds universe.gi.org

MOC Statement #2

- I will learn about the potential effects of GLP-1 agents on gastrointestinal adverse effects I may encounter in my GI practice including nausea and vomiting, intestinal obstruction, pancreatitis
- I will learn risks of complications I may encounter in the endoscopy room including:
 - Risk of retained gastric content
 - Risk of needing to re-schedule the procedure
 - Risk of aspiration of gastric contents

©2012 MFMR | slide-12

12

MOC Statement #3

- I will learn how to pre-procedurally manage patients in accordance with guidance from national organizations, with particular focus, in patients on GLP-1 agents on
 - Screening patients for symptoms of gastroparesis
 - Using 24 h liquid diet instead of just overnight fast
 - Deciding who should have GLP-1 agent stopped on the day before (liraglutide) or the week before (semaglutide, dulaglutide, extended exenatide, tirzepatide) the procedure
 - Point of care ultrasound?

©2012 MFMER | slide-13

13

Case Study

1 year ago: 44 y/o female, gravida 2, depressed since no amount of exercise or dieting has worked despite 5 years of effort and “yo-yo” weight

BMI 42.1kg/m²; weight 85kg (187 lb)
 Fasting Blood Glucose 185mg/dL; HbA1c 9.8%
 AST 90 iu/L; ALT 75 iu/L; fatty infiltration of liver on Ultrasound

1yr ago: Hypertension on amlodipine, bendrofluazide; DM2 on metformin
 Started on Semaglutide, dose-titrated from 0.25mg/week to 1.7mg/week

Last month: BMI 34kg/m²; weight 75kg (165 lb); FBG 102mg/dL; HbA1c 6%; off metformin

Delighted with outcome: dress size ↓ 2 sizes; off antihypertensives

“Background symptoms” nausea, postprandial fullness, constipation
 vomiting twice per month, mostly after eating large green salad

©2012 MFMER | slide-14

Virtual Grand Rounds

Glucagon-like Peptide 1

universe.gi.org

- Inhibits gastric emptying and motility
- Reduces appetite
- Increases insulin secretion, pancreatic β cell proliferation
- Reduces glucagon secretion
- Hypothalamus GLP-1 receptors regulate food intake through
 - Processes in nucleus tract solitarius
 - Direct stimulation of proopiomelanocortin and cocaine- and amphetamine-regulated transcript (POMC/CART)-expressing arcuate nucleus neurons and
 - Indirect inhibition of neuropeptide Y (NPY) and agouti-related peptide (AgRP) to increase satiety and decrease hunger

Radiolabeled Ensure at 30kcal/min to Maximum Tolerated Volume

19

Genetic encoding and peptide processing of GIP

- GIP is encoded by the GIP gene on chromosome 17, consisting of six exons. The majority of the sequence encoding GIP peptide is localized to exon 3 (highlighted in pink). A 153-amino acid long proGIP precursor is processed by prohormone convertase 1/3 to produce bioactive GIP1-42. GIP1-42 is rapidly degraded by dipeptidyl peptidase-4 (DPP4) into the inactive GIP3-42

Muller.....Tschop *Mol Metab.* 2025;95:102118

©2012 MFMER | slide-20

20

GIP: glucose-dependent insulinotropic peptide

- Inhibits acid secretion
- Increases insulin secretion and β cell proliferation in healthy humans, with markedly reduced insulinotropic effect in T2DM (*Nauck, Heimesaat, et al. 1993; Meier, Nauck, 2004*)
- Acute administration of GIP does not influence appetite and food intake in human participants e.g. in patients with T2DM receiving metformin and a long-acting GLP-1 receptor agonist (*Bergmann, Gasbjerg, et al. 2020*)

©2012 MFMER | slide-21

21

GIP: NO significant effect on gastric emptying of solids (250kcal)

i.v. GIP (2 pmol/kg/1min) or placebo (human serum albumin) from -30 to 360 min in 15 healthy male subjects.

25

Currently approved incretin agonists for treatment of type 2 DM and weight loss

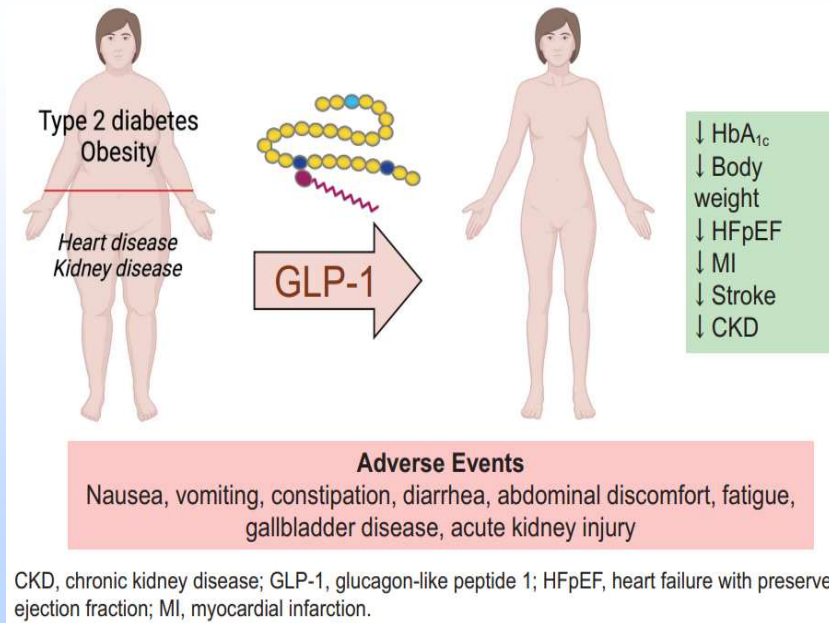

| Drug name (brand name) | Dose/ routes of Administration | Mechanisms of action | Indications | Elimination T _{1/2} | Common GI-related AEs | Recommendation on drug titration |
|---|--------------------------------|--|---|------------------------------|--|---|
| Short-acting GLP-1 RA | | | | | | |
| Exenatide (Byetta®) | Twice-daily SQ injection | ↑ glucose-dependent insulin secretion from pancreatic β cells Suppress glucagon secretion Delays gastric emptying | Glycemic control in T2DM | 2.4hr | nausea, diarrhea, vomiting | Start: 5mg BID Week 4: 10mg BID |
| Long-acting SQ GLP-1 RA | | | | | | |
| Liraglutide (Victoza®) | Once-daily SQ injection | ↑ glucose-dependent insulin secretion from pancreatic β cells Suppression of glucagon secretion Delay gastric emptying | Glycemic control in T2DM Weight management in adults with BMI >30 or BMI >27 + 1 weight related comorbidity (HTN, T2DM, HLD) | 13hr | nausea, vomiting, diarrhea, decreased appetite, constipation, dyspepsia and abdominal pain, eructation | Start: 0.6mg daily; increase dose by 0.6mg/week until full maintenance dose of 3mg) |
| Semaglutide SQ (Ozempic® or Wegovy®) | Once-weekly SQ injection | | Glycemic control in T2DM | 7 days | nausea, vomiting, diarrhea, abdominal pain, and constipation | Start: 0.25mg/week; Week 4: 0.50mg/week; Week 8: 1 mg/ week |
| Dulaglutide (Trulicity®) | | | Glycemic control in T2DM | 5 days | nausea, diarrhea, vomiting, dyspepsia | 1.5mg q. week |
| Exenatide ER (Bydureon®) | | | | 8-16hrs | nausea, diarrhea, vomiting | 2mg weekly (no dose adjustment) |
| Long-acting Oral GLP-1 RA | | | | | | |
| Semaglutide PO (Rybelsus®) | Once-daily per oral | ↑ glucose-dependent insulin secretion from pancreatic β cells; suppresses glucagon secretion; delays gastric emptying | Glycemic control in T2DM | 7 days | nausea, abdominal pain, diarrhea, decreased appetite, vomiting, constipation | Start: 3mg daily; Week 4: 7mg daily; Week 8: 14mg daily |
| Long-acting Dual Incretin GIP/GLP-1 RA | | | | | | |
| Tirzepatide (Mounjaro®) | Once-weekly SQ injection | ↑ insulin response; suppresses glucagon secretion; promotes satiety; improves insulin sensitivity | Glycemic control in T2DM and obesity | 5 days | nausea, vomiting, diarrhea, decreased appetite, constipation, dyspepsia, and abdominal pain | Start 2.5mg weekly; increase dose by 2.5mg/4 weeks until full maintenance dose of 15mg at week 20 |

Virtual Grand Rounds

universe.gi.org

Benefits of GLP-1 RAs on Obesity co-morbidities

- **Cardiovascular outcomes** in obesity with or without diabetes *Lincoff et al NEJM* 2023;389:2221-32; *Kosiborod et al NEJM* 2024;390:1394-1407
- Slowing the **motor progression of early Parkinson's disease** with lixisenatide *Meissner et al N Engl J Med* 2024;390(13):1176-1185
- Beneficial effects for **primary stroke, major adverse cardiovascular events, and cardiovascular mortality** prevention based on a SRMA of patients with diabetes treated with GLP-1 RAs in 8 randomized controlled trials *Malhotra et al N Engl J Med* 2024;390: 1176-1185.

©2012 MFMER | slide-28

28

Benefits of glycemic control and GLP-1RAs in diverse GI diseases

- Reduction of 10-year risk of **major adverse liver outcomes** (MALO): decompensated cirrhosis, HCC, liver transplantation or MALO-related death, based on Swedish healthcare registers (2010–2020). *Wester et al Gut 2024;73(5):835-843*
- NAFLD increases risk of T2D, malignancy, and other cardiometabolic disorders including incident **major adverse cardiovascular events** (MACE): THEREFORE, treat MASLD in obese young people *Byrne and Targher Gut 2023;72(7):1238-1239*
- Detrimental effects of lifestyle and diet on metabolic disorders and **developing IBD and a poor disease course** *Adolph et al Gut. 2024 May 22;gutjnl-2024-331914*.
- Optimal glycemic control (HbA1c <7%) in diabetes reduced risk of **colorectal adenoma and cancer in left-sided colon and rectum** *Mao et al Gut. 2024 Apr 3;gutjnl-2023-331701*.

32

Lower risk of IBD-related surgery in UC or CD in T2DM in pts on GLP-1RA

- Retrospective cohort study utilizing the TriNetX database comparing IBD-specific outcomes in patients with ulcerative colitis or Crohn's disease and type 2 diabetes mellitus (T2DM) on GLP-1RA compared to oral hypoglycemics
- 1:1 **propensity score matching** (PSM) for demographics, co-morbid conditions, BMI, laboratory values, HbA1c, and IBD medications including steroids.
- 1130 UC and 1140 CD on GLP-1 RAs
- **RESULTS:** no difference in the risk of intravenous steroid use, oral steroid use or advanced therapy initiation for UC or CD
- **Lower risk of colectomy** (aHR: 0.37, 95% CI:0.14–0.97) in UC GLP-1RA vs control
- **Lower risk of surgery** (aHR: 0.55, 95% CI: 0.36–0.84) in CD GLP-1RA vs control
- NO increased GI adverse effects (biliary disease, pancreatitis, gastroparesis, ileus)

Gastric emptying delay in response to GLP-1 RA liraglutide

Effect of liraglutide escalated up to 3.0 mg/day on gastric emptying of solid 320kcal 30% fat meal in 67 patients with obesity without DM2: 42% had no slowing of GE $T_{1/2}$ at any time, whereas **57% had very significant delay in GE $T_{1/2}$ at 5 weeks** and 1 participant developed delay by 16 weeks. In those who developed delay, 20/39 (51%) had persistent slowing of GE $T_{1/2}$, whereas 19/39 had marked improvement or normalization of GE $T_{1/2}$ at 16 weeks. Data censored at maximum 240min. In summary, **20/67 (30%) pts have persisted GE delay for at least 16 wks**

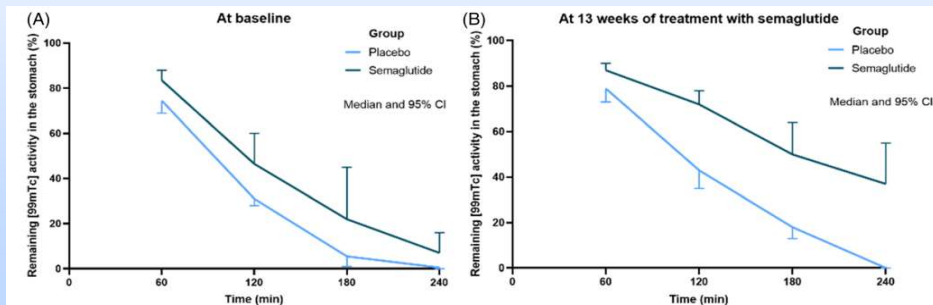

Camilleri M et al Obesity (Silver Spring). 2024;32: 232-233

38

Glucagon

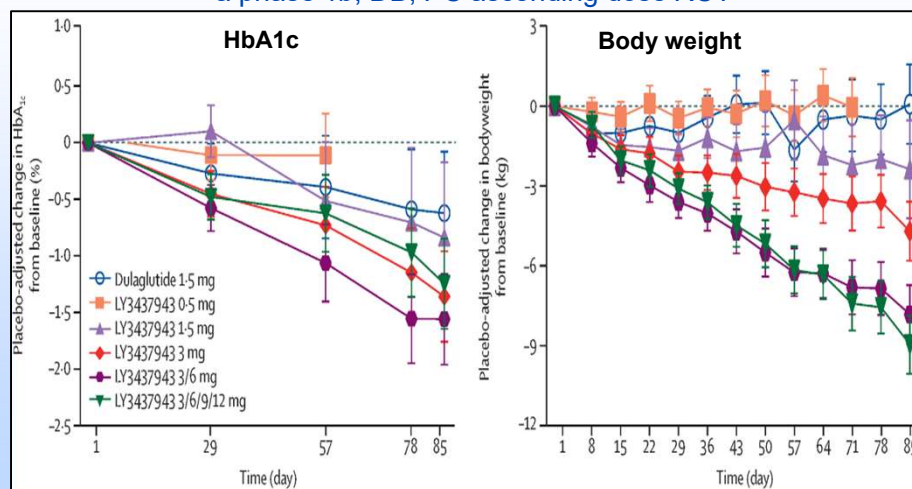

- Glucagon is produced by **islet α -cells** and is an important **insulin secretagogue** at least at the concentrations found within the islet.
- α -cell dysfunction as occurs in T2DM, prediabetes results in increased glucagon concentrations.
- Abnormal α -cell function represents an effort to stimulate (failing) β -cell function in these situations.
- Glucagon **can signal through GLP1R on β -cells**
- Intra-islet concentrations of glucagon are sufficiently high to stimulate GLP1R
- Glucagon receptor (Gcgr) is unnecessary for glucagon-induced insulin secretion

52

Influence of semaglutide on presence of residual gastric solids on gastric ultrasound: a prospective study in volunteers

Figure Image showing layered appearance of solid contents in a patient in the semaglutide group

| Variable | Semaglutide N = 10 | Control N = 10 | RR (95% CI) | P value |
|---|-----------------------|-------------------|---------------------|---------|
| Stomach contents in supine position after overnight fast, n/total N (%) solids | 7/10 (70%) | 1/10 (10%) | 3.50 (1.26 to 9.65) | 0.02 |
| Stomach contents in lateral position after overnight fast, n/total N (%) solids | 9/10 (90%) | 1/10 (10%) | 7.36 (1.13 to 47.7) | 0.005 |
| Stomach contents in supine position clear ingestion and 2-hour fast | | | | 0.02 |
| Liquids, n/total N (%) | 2/10 (20%) | 1/10 (10%) | | |
| Solids, n/total N (%) | 5/10 (50%) | 0/10 (0%) | | |
| Stomach contents in lateral position clear ingestion and 2-hour fast | | | | 0.06 |
| Liquids, n/total N (%) | 2/10 (20%) | 3/10 (30%) | | |
| Solids, n/total N (%) | 6/10 (60%) | 1/10 (10%) | | |

CI = confidence interval; RR = risk ratio

GLP-1RAs may affect gastric emptying and residual gastric contents following an overnight fast and two hours after clear liquids, which may have implications for aspiration risk during anesthetic care.

What do national organizations recommend?

©2012 MFMR | slide-61

61

ACG Virtual Grand Rounds universe.gi.org

American Society of Anesthesiologists recommendations for pts scheduled for elective procedures during week prior to procedure OR on the day of the procedure

| | |
|---|--|
| <p>Day or week prior to the procedure:</p> | <ul style="list-style-type: none"> • Hold on the day of the procedure/surgery for patients who take the medication daily. • Hold a week prior to the procedure/surgery for patients who take the medication weekly. • Consider Endocrinology consultation for patients taking GLP-1 RA for diabetes management for better glycemic control. |
| <p>Day of the procedure:</p> | <ul style="list-style-type: none"> • If GI symptoms present: Consider delaying the procedure. • If no GI symptoms presents and GLP-1 held as advised: Continue with the procedure. • If the patient has no GI symptoms, but the GLP-1 RA was not held, assume the patient has a “full stomach” or consider using ultrasound to evaluate the stomach contents. If full, consider delaying procedure. |

<https://www.asahq.org/about-asahq/newsroom/news-releases/2023/06/patients-taking-popular-medications-for-diabetes-and-weight-loss-should-stop-before-elective-surgery>

62

Multisociety Clinical Practice Guidance for the Safe Use of GLP-1 RAs in Perioperative Period

- **Recommendation 1** Use of GLP-1RAs in perioperative period should be based on shared decision-making of the patient with procedural, anesthesia, and prescribing care teams balancing the metabolic need for the GLP-1RA with individual pt risk:
 - A. **CONSIDER**
 - Escalation phase vs maintenance phase
 - Higher dose
 - Weekly dosing: GI side AEs more common vs daily
 - Presence of GI symptoms suggestive of delayed GE
 - Medical conditions beyond GLP-1RA usage e.g. Diabetic, Parkinson
 - B. Continue GLP-1RA in pts **without** ↑risk of delayed GE
 - C. **If ↑ risk:** holding the day of surgery for daily formulations, and a week prior to surgery for weekly formulations.

All patients should still be assessed on the day of procedure for symptoms suggestive of delayed gastric emptying.

Kindel, Yang et al *Clinical Gastroenterology and Hepatology* 2024;Oct 29

©2012 MFMER | slide-61

63

Virtual Grand Rounds

universe.gi.org

Multisociety Clinical Practice Guidance for the Safe Use of GLP-1 RAs in Perioperative Period

- **Recommendation 2:** Efforts to minimize the aspiration risk of delayed gastric emptying by *pre-operative diet modification and/or altering anesthesia plan*:
 - A. Preoperative diet modification (preoperative liquid diet for at least 24 hours) If ↑ risk
 - B. When clinical concern for RGC exists on the day of procedure:
 - point-of-care gastric ultrasound
 - shared decision-making and consider the benefits and risks of rapid sequence induction of GA for tracheal intubation to minimize aspiration risk versus procedure cancellation

Kindel, Yang et al *Clinical Gastroenterology and Hepatology* 2024;Oct 29

64

ACG Virtual Grand Rounds universe.gi.org

Take Home Points for Gastroenterology Practice

- There are significant benefits of GLP-1 RAs on obesity and co-morbidities including heart, GI and liver
- Currently approved incretin agonists commonly used: Dulaglutide, Liraglutide, Semaglutide, Tirzepatide
- Effects on gastric emptying: positives (weight loss) and negatives (nausea and vomiting: TITRATE the escalating dose)
- Other GI adverse effects: biliary and pancreatic, rarely gastroparesis
- EGD: Retained gastric content is rare, and repeat EGD rarely needed
- Risk of aspiration extremely rare and probably similar to control
- Recommendations: For **elective EGDs**, stop GLP-1 **according to drug $T_{1/2}$**
- For **urgent EGD**, request Ultrasound test or I.V. erythromycin 3mg/kg

MAYO CLINIC ©2012 MFMR | slide-65

65

ACG Virtual Grand Rounds universe.gi.org

Case Study

Last month: BMI 34kg/m²; weight 75kg (165 lb); FBG 102mg/dL; HbA1c 6%; off metformin

Delighted with outcome: dress size ↓ 2 sizes; off antihypertensives

“Background symptoms” nausea, postprandial fullness, constipation
vomiting twice per month, mostly after eating large green salad

Recommendations: Continue GLP-1 RA; blenderized diet when symptomatic; tell your GI if you are going to undergo endoscopy; liquid diet for 24h before procedure; work on lifestyle interventions to maximize and secure longterm weight loss and metabolic bonanza
